

# Lecture 7. Digital Communications Part II. Digital Modulation

1

- Digital Baseband Modulation
- Digital Bandpass Modulation

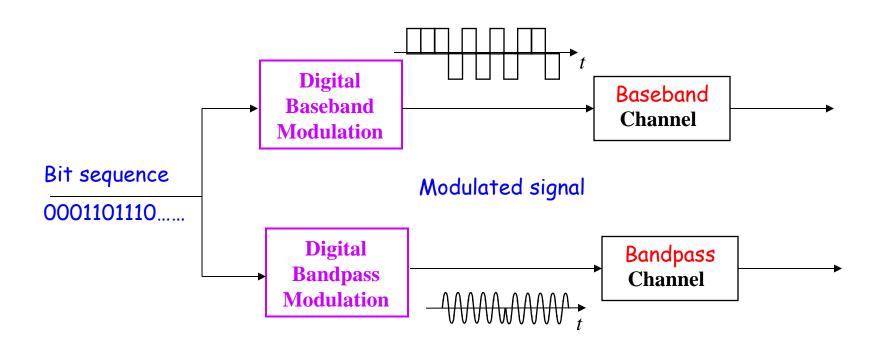

# **Digital Communications**

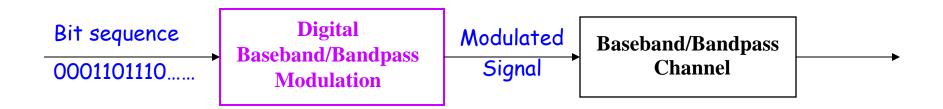

# **Digital Modulation**

How to choose proper digital waveforms to "carry" the digits?

# **Digital Modulation**

- Bit Rate: number of bits transmitted in unit time
- Required channel bandwidth: determined by the bandwidth of the modulated signal.
- Bandwidth Efficiency:

 $\triangleq \frac{\text{Information Bit Rate } R_b}{\text{Required Channel Bandwidth } B_b}$ 

# **Digital Baseband Modulation**

- Pulse Amplitude Modulation (PAM)
- Pulse Shaping

Lin Dai (City University of Hong Kong) EE3008 Principles of Communications Lecture 7

5

# **Digital Baseband Modulation**

- Choose baseband signals to carry the digits.
  - Each baseband signal can carry multiple bits.
    - Each baseband signal carries 1 bit.

**Binary** • Bit Rate: 
$$R_b = 1/\tau$$

- Totally 2 baseband signals are required.
- Each baseband signal carries a symbol (with log<sub>2</sub>M bits).
- **M-ary** Symbol Rate:  $R_s = 1/\tau$  Bit Rate:  $R_b = (\log_2 M)/\tau$ 
  - Totally M baseband signals are required.

# **Digital Baseband Modulation**

7

Read the

supplemental material for details.

- Focus on "amplitude modulation"
  - The baseband signals have the same shape, but different amplitudes.
  - Time-domain representation of the modulated signal:

$$s(t) = \sum_{n = -\infty}^{\infty} Z_n \cdot v(t - n\tau)$$

where  $Z_n$  is a discrete random variable with  $Pr\{Z_n = a_i\} = 1/M$ , i = 1,...,M, v(t) is a unit baseband signal.

- Power spectrum of the modulated signal:

$$G_{s}(f) = \frac{1}{\tau} |V(f)|^{2} \cdot \left(\sigma_{Z}^{2} + \frac{\mu_{Z}^{2}}{\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right)\right)$$

# Pulse Amplitude Modulation (PAM)

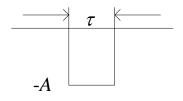

- Binary PAM
- Binary On-Off Keying (OOK)
- 4-ary PAM

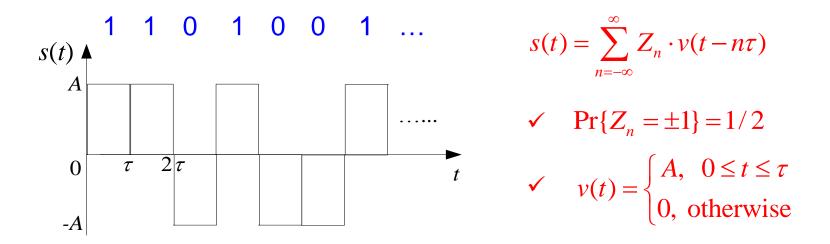

# **Binary PAM**

1: a positive rectangular pulse with amplitude A and width  $\tau$ 

0: a negative rectangular pulse with amplitude -A and width  $\tau$ 

#### **Power Spectrum of Binary PAM**

$$G_{s}(f) = \frac{1}{\tau} |V(f)|^{2} \cdot \left(\sigma_{Z}^{2} + \frac{\mu_{Z}^{2}}{\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right)\right)$$
With Binary PAM:  $V(f) = A\tau \operatorname{sinc}(f\tau)$   
 $\mu_{Z} = 0, \ \sigma_{Z}^{2} = 1$ 

$$G_{BPAM}(f) = A^{2}\tau \operatorname{sinc}^{2}(f\tau)$$

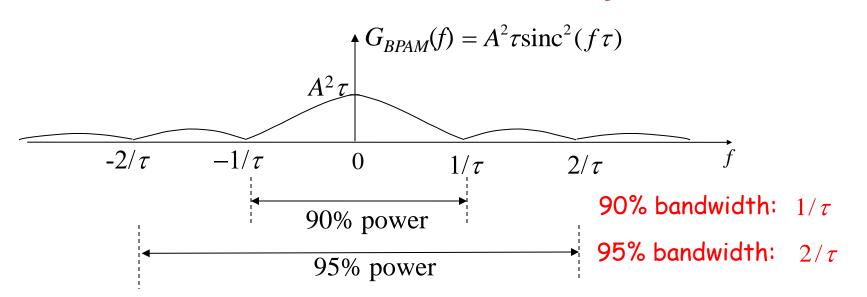

$$G_{BPAM}(f)$$

$$\frac{A^{2}\tau}{\tau}$$

See Textbook (Sec. 3.2) or Reference [Proakis & Salehi] (Sec. 8.2) for more details.

#### **Effective Bandwidth of Binary PAM**

• Suppose 90% of signal power must pass through the channel (90% in-band power): Required Channel Bandwidth:  $B_{h_{-}90\%} = 1/\tau$ Bit rate:  $R_{b} = 1/\tau$   $B_{h_{-}90\%} = R_{b}$ 

• Suppose 95% of signal power must pass through the channel (95% in-band power): Required Channel Bandwidth:  $B_{h_{-}95\%} = 2/\tau = 2R_b$ 

### Bandwidth Efficiency of Binary PAM

• Bandwidth Efficiency :  $\gamma = \frac{\text{Information Bit Rate } R_b}{\text{Required Channel Bandwidth } B_h}$ 

• Bandwidth Efficiency of Binary PAM:

#### What if the two pulses have unsymmetrical amplitudes?

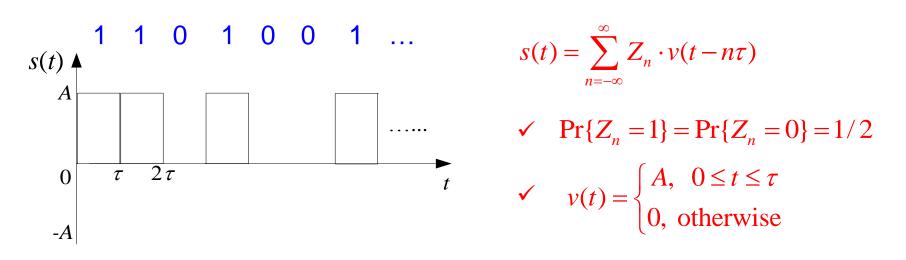

# **Binary On-Off Keying (OOK)**

1: a positive rectangular pulse with amplitude A and width  $\tau$ 

 $\begin{array}{c|c} A \\ \hline \\ \hline \\ \hline \\ \hline \\ \hline \\ \end{array} \end{array} \xrightarrow{} \tau \longleftarrow$ 

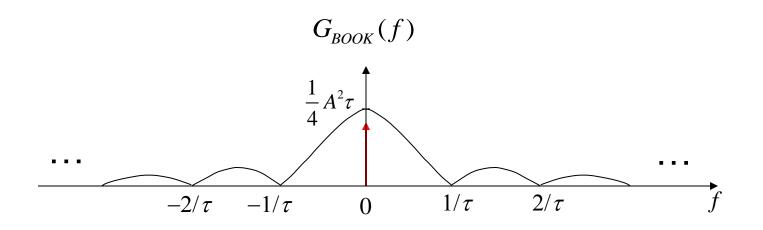

0: nothing (can be regarded as a pulse with amplitude 0)

#### **Power Spectrum of Binary OOK**

$$G_{s}(f) = \frac{1}{\tau} |V(f)|^{2} \cdot \left(\sigma_{Z}^{2} + \frac{\mu_{Z}^{2}}{\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right)\right)$$
  
With Binary OOK:  $V(f) = A\tau \operatorname{sinc}(f\tau)$   
 $\mu_{Z} = 1/2, \ \sigma_{Z}^{2} = 1/4$ 
$$G_{BOOK}(f) = \frac{1}{\tau} \left(A\tau \operatorname{sinc}(f\tau)\right)^{2}$$
  
 $\left(\frac{1}{4} + \frac{1}{4\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right)\right)$ 

#### **Bandwidth Efficiency of Binary OOK**

• Bandwidth Efficiency :

 $\gamma = \frac{\text{Information Bit Rate } R_b}{\text{Required Channel Bandwidth } B_h}$ 

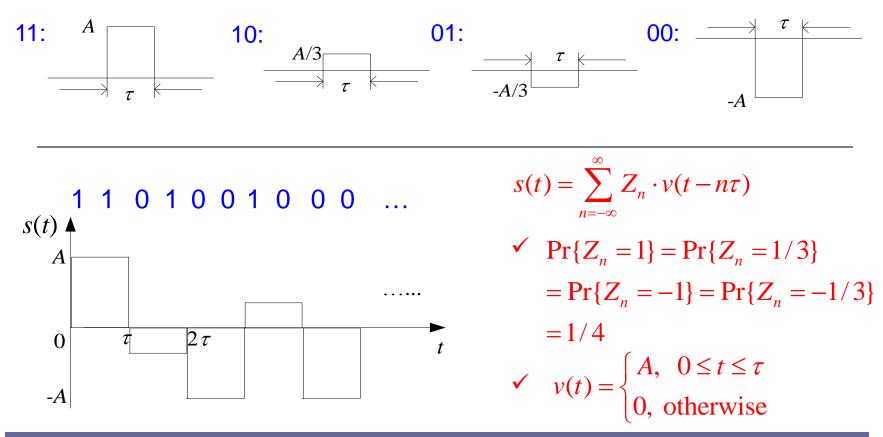

• Bandwidth Efficiency of Binary OOK:

#### Can we improve the bandwidth efficiency without sacrificing the in-band power?

## 4-ary PAM

• 4-ary PAM: Each waveform carries 2-bit information.

#### **Power Spectrum of 4-ary PAM**

$$G_{s}(f) = \frac{1}{\tau} |V(f)|^{2} \cdot \left(\sigma_{Z}^{2} + \frac{\mu_{Z}^{2}}{\tau} \sum_{m=\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right)\right)$$
With 4-ary PAM:  $V(f) = A\tau \operatorname{sinc}(f\tau)$   
 $\mu_{Z} = 0, \ \sigma_{Z}^{2} = 5/9$ 

$$G_{4PAM}(f)$$

$$G$$

- Required channel bandwidth with 90% in-band power:  $B_{h_{-}90\%} = 1/\tau$
- Required channel bandwidth with 95% in-band power:  $B_{h_{-}95\%} = 2/\tau$

#### **Bandwidth Efficiency of 4-ary PAM**

- Symbol rate:  $R_s = 1/\tau$
- Bit rate:  $R_b = 2 \cdot R_s = 2/\tau$
- Require channel bandwidth:
   with 90% in-band power: B<sub>h\_9</sub>
   with 95% in-band power: B<sub>h\_9</sub>

 $B_{h_{-}90\%} = 1/\tau = R_{S} = \frac{1}{2}R_{b}$  $B_{h_{-}95\%} = 2/\tau = 2R_{S} = R_{b}$ 

4-ary PAM achieves higher bandwidth efficiency than binary PAM!

## Bandwidth Efficiency of M-ary PAM

- Suppose there are totally *M* distinct amplitude (power) levels.
- How many bits are carried by each symbol?

$$M = 2^k \implies k = \log_2 M$$

• What is the relationship between symbol rate  $R_s$  and bit rate  $R_b$ ?

$$R_s = R_b / k$$
 or  $R_b = kR_s$ 

• What is the required channel bandwidth with 90% in-band power?

$$B_{h_{90\%}} = R_{S} = R_{b} / k$$

Bandwidth Efficiency of M-ary PAM

Tradeoff between bandwidth efficiency and fidelity performance

 $\gamma_{MPAM} = k = \log_2 M$  with 90% in-band power

• A larger *M* also leads to a smaller minimal amplitude difference – higher error probability (to be discussed).

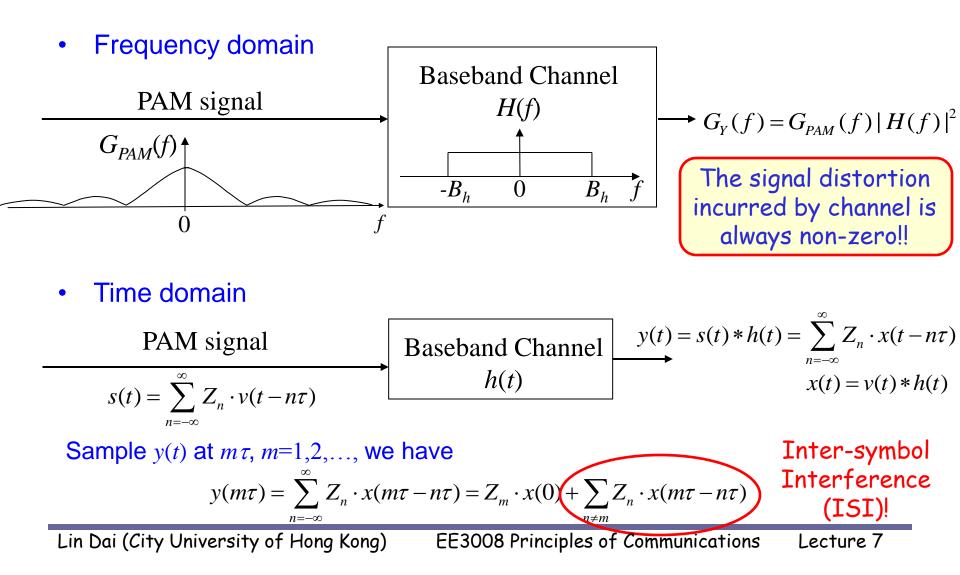

# **Pulse Shaping**

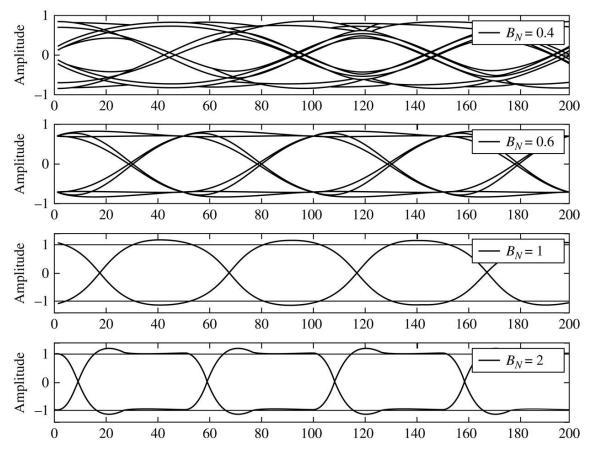

- Inter-Symbol Interference (ISI)
- Sinc-Shaped Pulse and Raised-Cosine Pulse

### **Transmission over Bandlimited Channel**

#### **ISI and Eye Diagram**

- An eye diagram is constructed by plotting overlapping k-symbol segments of a baseband signal.
- An eye diagram can be displayed on an oscilloscope by triggering the time sweep of the oscilloscope.

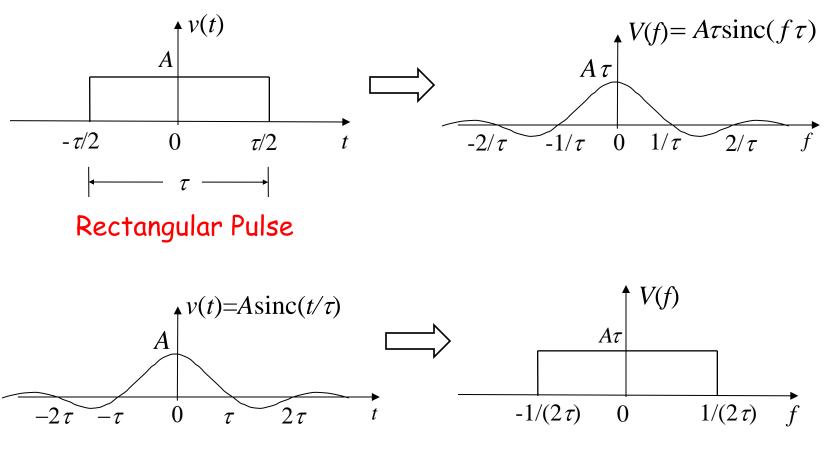

See Reference [Ziemer & Tranter] (Sec. 4.6) for more details about eye diagram.

- ISI is caused by insufficient channel bandwidth.
- Any better choice than rectangular pulse?

Sinc-Shaped pulse

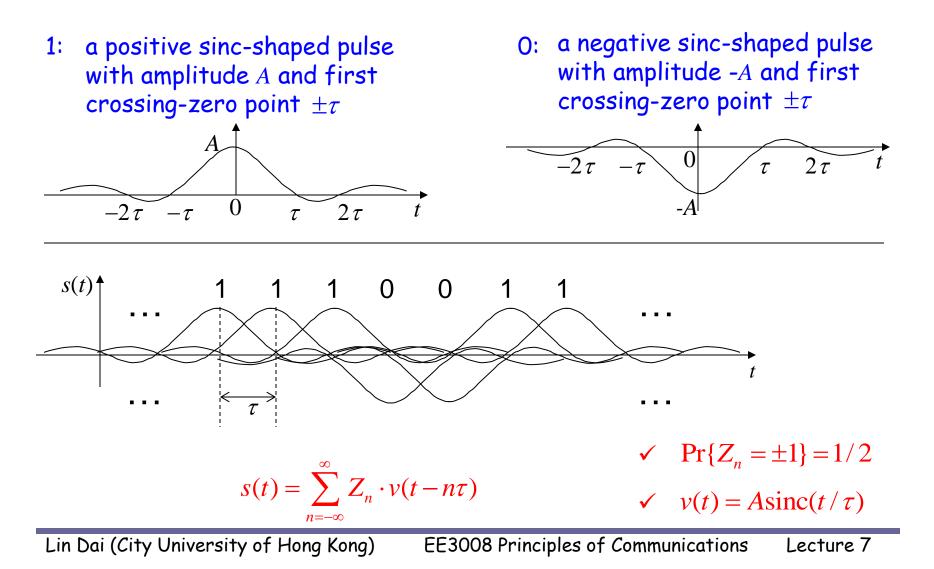

#### **Sinc-Shaped Pulse**

Sinc-Shaped Pulse

## **Binary Sinc-Shaped-Pulse Modulated Signal**

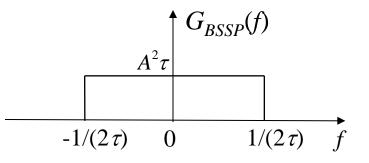

24

### **Power Spectrum of Sinc-Shaped-Pulse Modulated Signal**

$$G_{s}(f) = \frac{1}{\tau} |V(f)|^{2} \cdot \left(\sigma_{Z}^{2} + \frac{\mu_{Z}^{2}}{\tau} \sum_{m=-\infty}^{\infty} \delta\left(f - \frac{m}{\tau}\right)\right)$$
  
With Binary Sinc-Shaped- $\mu_{Z} = 0, \ \sigma_{Z}^{2} = 1$   
Pulse Modulated Signal:  $V(f) = A\tau, \ |f| \leq \frac{1}{2\tau}$  
$$G_{BSSP}(f) = A^{2}\tau, \ |f| \leq \frac{1}{2\tau}$$

Bit Rate:  $R_b = 1/\tau$ 

Required channel bandwidth:  $B_h = 1/(2\tau) = R_b/2$ 

Lin Dai (City University of Hong Kong) EE3008 Principles of Communications Lecture 7

$$\gamma_{BSSP} = 2$$

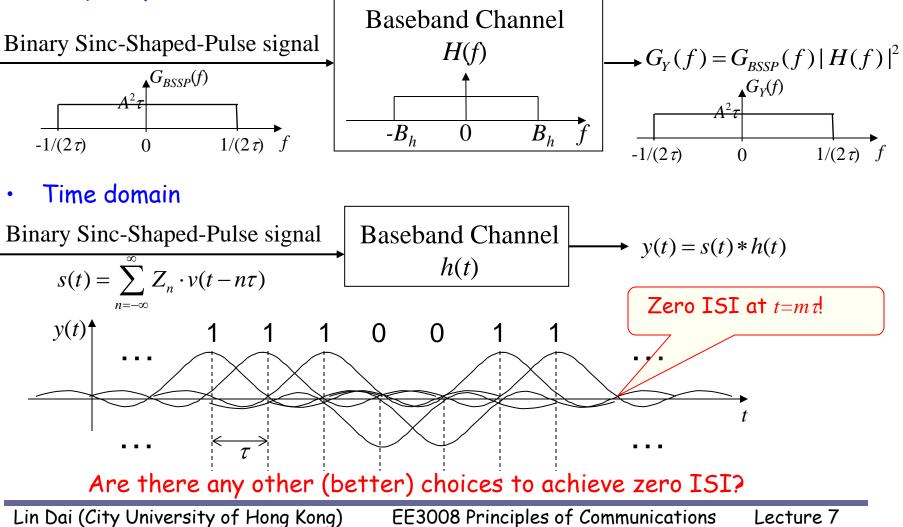

(with 100% in-band power)

### Sinc-Shaped-Pulse Modulated Signal over Bandlimited Channel

26

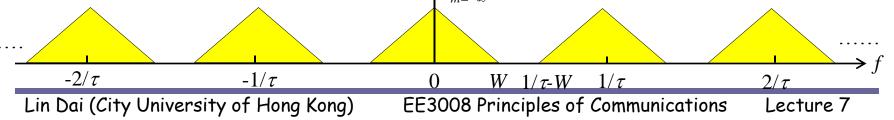

• Frequency domain

Nyquist Pulse-Shaping Criterion for Zero ISI Nyquist pulse-shaping criterion for zero ISI A necessary and sufficient condition for pulse v(t) to satisfy  $v(n\tau) = \begin{cases} 1, & n=0 \\ 0, & n \neq 0 \end{cases}$ is that its Fourier transform V(f) satisfies  $\sum_{m=-\infty}^{\infty} V(f + \frac{m}{\tau}) = \tau$ .

Suppose that the bandwidth of unit pulse v(t) is W, which is also the required channel bandwidth. To pass the digital modulated signal with symbol rate  $1/\tau$  through the channel:

• If  $1/\tau$ -W>W, there is no way to satisfy the Nyquist pulse-shaping criterion for zero ISI.  $\uparrow \sum_{m=-\infty}^{\infty} V(f + \frac{m}{\tau}) \neq \tau$ 

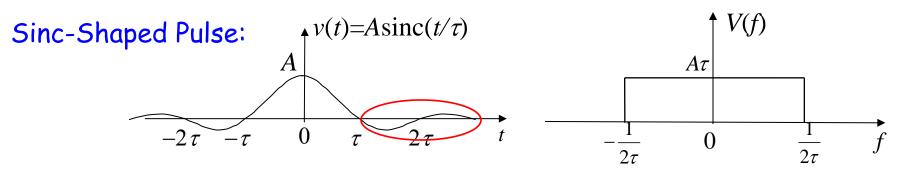

## Nyquist Pulse-Shaping Criterion for Zero ISI

According to Nyquist pulse-shaping criterion for zero ISI:

- $\checkmark\,$  If the symbol rate 1/ $\tau$ >2W, there is no way that we can design a system with zero ISI.
- ✓ If the symbol rate 1/ $\tau$ =2W, we must have  $V(f) = \begin{cases} \tau, & |f| < W \\ 0, & \text{otherwise} \end{cases}$ 
  - The maximum symbol rate for zero ISI is 2W.
  - In the binary case, the highest bandwidth efficiency for zero-ISI is
     2, which is achieved by the binary sinc-shaped-pulse modulated signal.
- ✓ If the symbol rate  $1/\tau$ <2W, we have numerous choices. One of them is called Raised-Cosine Pulse.

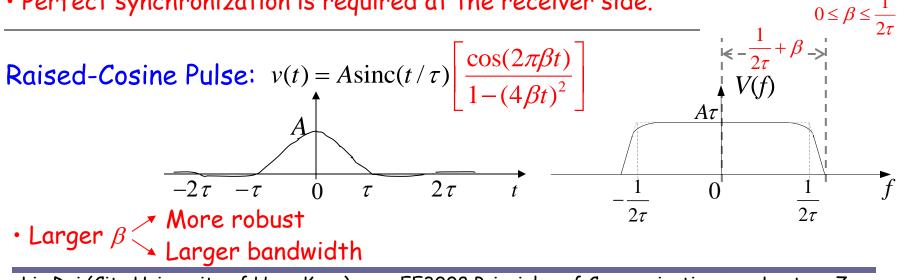

See Textbook (Sec. 4.4) for more details.

## Raised-Cosine Pulse: Tradeoff between Bandwidth **Efficiency and Robustness**

• Strong ISI at  $t \neq n\tau$ .

• Perfect synchronization is required at the receiver side.

#### **Summary I: Digital Baseband Modulation**

		Complexity	Bandwidth Efficiency
PAM	Binary PAM	Low	1 (90% in-band power)
	4-ary PAM	Low	2 (90% in-band power)
Binary Sinc- Shaped-Pulse Modulation		High (Susceptible to timing jitter)	2 (100% in-band power)
Binary Raised- Cosine-Pulse Modulation		Moderate	$1 < \frac{R_b}{\frac{1}{2}R_b + \beta} < 2$ (100% in-band power)

Lin Dai (City University of Hong Kong)

EE3008 Principles of Communications Lecture 7

# **Digital Bandpass Modulation**

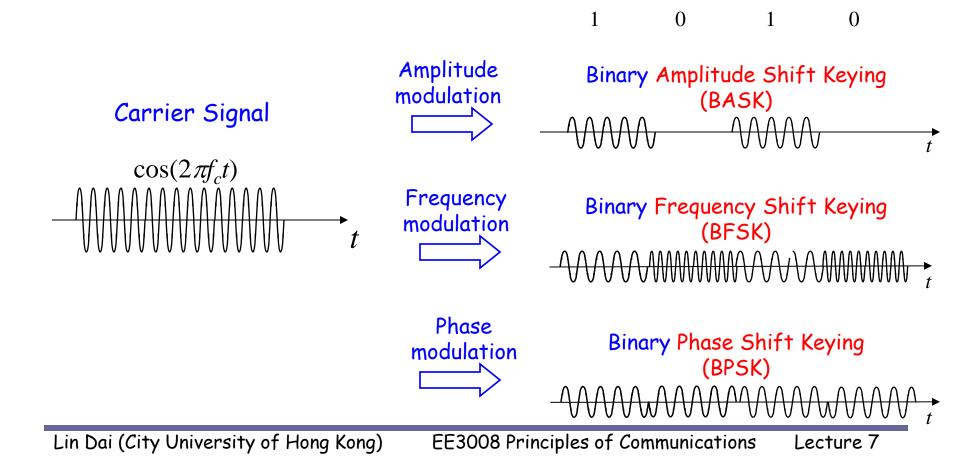

- Binary ASK
- Binary FSK
- Binary PSK
- Quaternary PSK

Lin Dai (City University of Hong Kong)

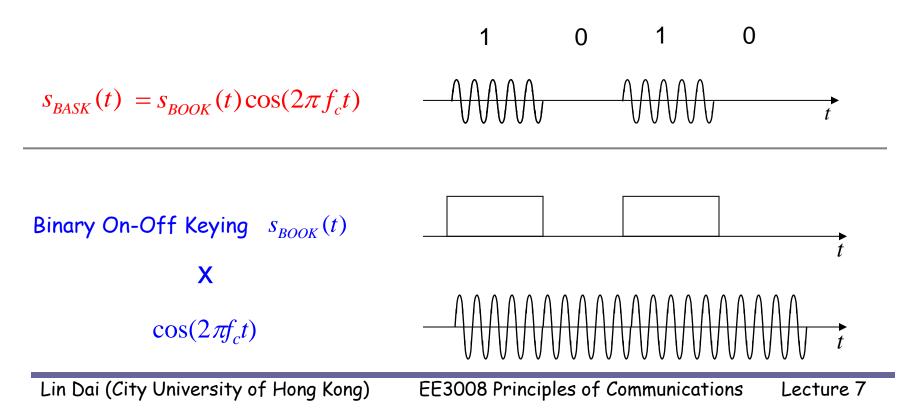

# **Digital Bandpass Modulation**

• How to transmit a baseband signal over a bandpass channel?

# **Binary Amplitude Shift Keying (ASK)**

- Generate a binary ASK signal:
  - Send the carrier signal if the information bit is "1";
  - Send 0 volts if the information bit is "0".

## **Power Spectrum of BASK**

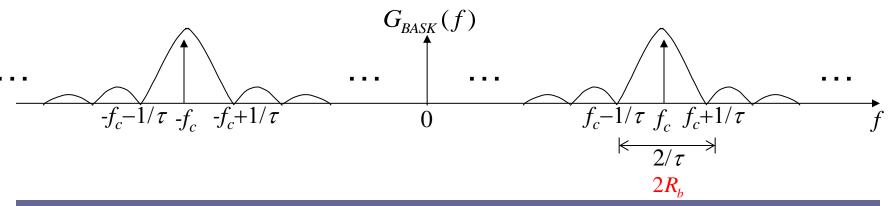

• Power spectrum of Binary OOK:

$$G_{BOOK}(f) = \frac{1}{\tau} \left( A\tau \operatorname{sinc}(f\tau) \right)^2 \cdot \left( \frac{1}{4} + \frac{1}{4\tau} \sum_{m=-\infty}^{\infty} \delta\left( f - \frac{m}{\tau} \right) \right)$$

• Power spectrum of Binary ASK:

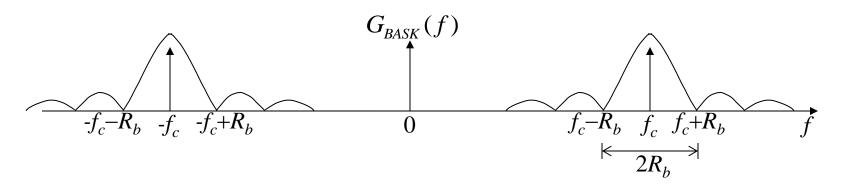

$$G_{BASK}(f) = \frac{1}{4} [G_{BOOK}(f - f_c) + G_{BOOK}(f + f_c)]$$

Read the supplemental material for details.

#### **Bandwidth Efficiency of BASK**

The bandwidth of BASK signal is twice of that of its baseband signal (binary On-Off Keying)!

• The required channel bandwidth for 90% in-band power:

$$B_{h_{-}90\%} = 2R_b$$

Bandwidth Efficiency of BASK:

 $\gamma_{BASK} = 0.5$  with 90% in-band power

 $\gamma_{BASK} = 0.25$  with 95% in-band power

## **Binary Frequency Shift Keying (BFSK)**

- Generate a binary FSK signal: 
   Frequency offset
  - Send the signal  $A\cos(2\pi(f_c + \Delta f)t)$  if the information bit is "1";
  - Send the signal  $A\cos(2\pi(f_c \Delta f)t)$  if the information bit is "0".

$$s_{BFSK}(t) = \underbrace{s_{b1,BFSK}(t)}_{\downarrow} \cos(2\pi(f_c + \Delta f)t) + \underbrace{s_{b2,BFSK}(t)}_{\downarrow} \cos(2\pi(f_c - \Delta f)t)$$

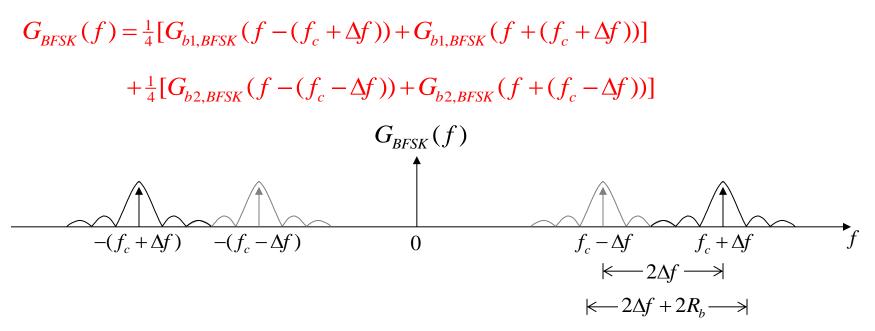

$$s_{b1,BFSK}(t) = \begin{cases} A & b_i = 1 \\ 0 & b_i = 0 \end{cases}$$

$$s_{b2,BFSK}(t) = \begin{cases} 0 & b_i = 1 \\ A & b_i = 0 \end{cases}$$
Binary On-Off Keying
$$0 & 1 & 0 & 1$$

$$\underbrace{0 & 1 & 0 & 1}_{\downarrow}$$
Lin Dai (City University of Hong Kong)
$$EE3008 \operatorname{Principles} of Communications \quad \text{Lecture 7}$$

#### Bandwidth Efficiency of BFSK

• The required channel bandwidth for 90% in-band power:

$$B_{h_{90\%}} = 2\Delta f + 2R_b$$

• Bandwidth efficiency of BFSK: (with 90% in-band power)

SK:  $\gamma_{BFSK} = 0.5 \cdot \frac{1}{1 + \Delta f / R_b} < 0.5 = \gamma_{BASK}$ 

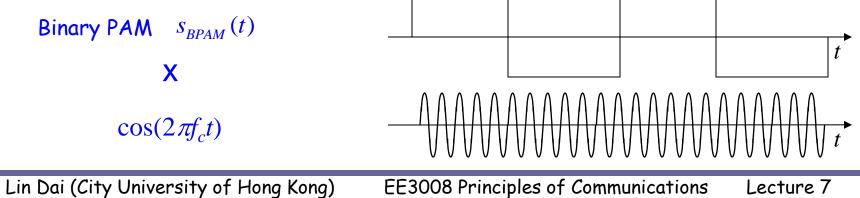

The bandwidth efficiency of BFSK signal is lower than that of BASK signal!

# **Binary Phase Shift Keying (BPSK)**

- Generate a binary PSK signal:
  - Send the signal  $A\cos(2\pi f_c t)$  if the information bit is "1";
  - Send the signal  $A\cos(2\pi f_c t + \pi)$  if the information bit is "0". =  $-A\cos(2\pi f_c t)$

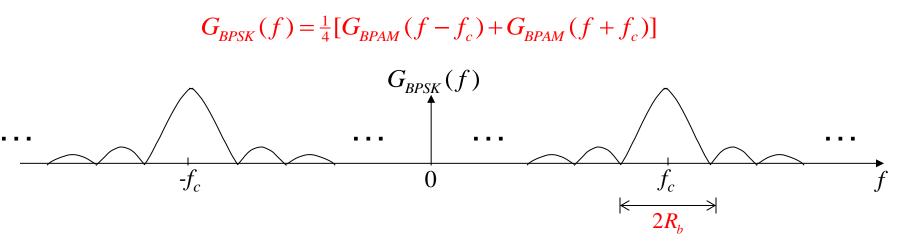

$$s_{BPSK}(t) = s_{BPAM}(t)\cos(2\pi f_c t)$$

 $1 \quad 0 \quad 1 \quad 0$ 

#### **Bandwidth Efficiency of BPSK**

• The required channel bandwidth for 90% in-band power:

$$B_{h_{90\%}} = 2R_b$$

Bandwidth Efficiency of BPSK:

$$\gamma_{BPSK} = 0.5$$
 with 90% in-band power

 $\gamma_{BPSK} = 0.25$  with 95% in-band power

The bandwidth efficiency of BPSK signal is the same as that of BASK signal!

# **M-ary PSK**

- M-ary PSK: transmitting pulses with *M* possible different carrier phases, and allowing each pulse to represent log<sub>2</sub>*M* bits.
  - ✓ Binary PSK: "1"  $s_1(t) = A\cos(2\pi f_c t)$ "0"  $s_2(t) = A\cos(2\pi f_c t + \pi)$

✓ Quaternary PSK: "11"  $s_1(t) = A\cos(2\pi f_c t + (-\pi/4))$ (QPSK) "10"  $s_2(t) = A\cos(2\pi f_c t + \pi/4)$ "00"  $s_3(t) = A\cos(2\pi f_c t + 3\pi/4)$ "01"  $s_4(t) = A\cos(2\pi f_c t + 5\pi/4)$ 

#### **QPSK**

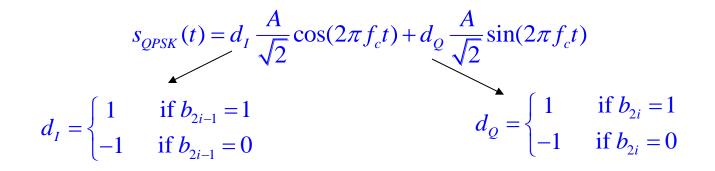

"1 1" 
$$s_1(t) = A\cos(2\pi f_c t - \pi/4) = +\frac{A}{\sqrt{2}}\cos(2\pi f_c t) + \frac{A}{\sqrt{2}}\sin(2\pi f_c t)$$
  
"1 0"  $s_2(t) = A\cos(2\pi f_c t + \pi/4) = +\frac{A}{\sqrt{2}}\cos(2\pi f_c t) - \frac{A}{\sqrt{2}}\sin(2\pi f_c t)$   
"0 0"  $s_3(t) = A\cos(2\pi f_c t + 3\pi/4) = -\frac{A}{\sqrt{2}}\cos(2\pi f_c t) - \frac{A}{\sqrt{2}}\sin(2\pi f_c t)$   
"0 1"  $s_4(t) = A\cos(2\pi f_c t + 5\pi/4) = -\frac{A}{\sqrt{2}}\cos(2\pi f_c t) + \frac{A}{\sqrt{2}}\sin(2\pi f_c t)$ 

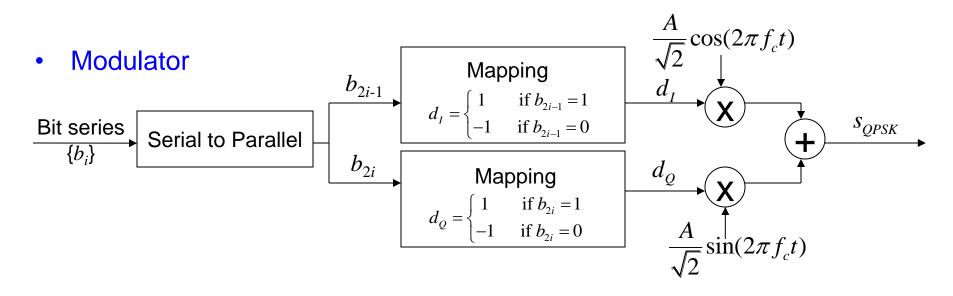

A QPSK signal can be decomposed into the sum of two PSK signals: an in-phase component and a quadrature component.

$$s_{QPSK}(t) = d_{I} \frac{A}{\sqrt{2}} \cos(2\pi f_{c}t) + d_{Q} \frac{A}{\sqrt{2}} \sin(2\pi f_{c}t)$$
$$d_{I} = \begin{cases} 1 & \text{if } b_{2i-1} = 1 \\ -1 & \text{if } b_{2i-1} = 0 \end{cases}$$
$$d_{Q} = \begin{cases} 1 & \text{if } b_{2i} = 1 \\ -1 & \text{if } b_{2i} = 0 \end{cases}$$

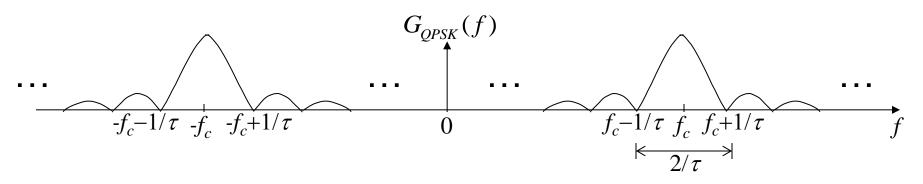

#### **QPSK Modulator**

#### **Bandwidth Efficiency of QPSK**

- Symbol rate:  $R_{S,QPSK} = 1/\tau$
- Required Channel Bandwidth:

• Bit rate: 
$$R_{b,QPSK} = 2R_{S,QPSK} = 2/\tau$$

$$B_{h_{90\%}} = 2R_{S,QPSK} = R_{b,QPSK}$$
$$B_{h_{95\%}} = 4R_{S,QPSK} = 2R_{b,QPSK}$$

Bandwidth Efficiency:

$$\gamma_{QPSK} = 1$$
 with 90% in-band power  
 $\gamma_{QPSK} = 0.5$  with 95% in-band power

QPSK achieves higher bandwidth efficiency than BPSK!

	Bandwidth Efficiency (90% in-band power)	
Binary ASK	0.5	
Binary FSK	$0.5 \cdot \frac{1}{1 + \Delta f / R_b}$	
Binary PSK	0.5	
QPSK	1
