

**Mr CHOW Kai Man German (2002 BEngEE, 2004 MPhil)**

Mr Chow is the co-founder/director of the company Propagation Systems Limited, an electronic solutions company founded in 2009.

The practicality of both his CityU EE degrees help him lay his pathway from engineering to programming and help with his later business startup. Due to his keen interest in electronics and mechanics from an early age, Mr Chow was indecisive among choosing EE or ME degree programmes. But he ended up choosing EE at CityU due to its versatility. The EE programme at CityU also offers low-level programming as well as the electronics design courses beside basic electronic engineering knowledge, which offer wider applications for one's career pathway.

During his study in CityU EE, Mr Chow found that hands-on experience and interactions with the EE industry was the most valuable experience. For instance, joining IPS and summer internship helped him understand more of his ability and passion of becoming an engineer.

He encourages our current EE students to explore their own interests when studying in university. It does not necessarily have to be related to one's field of study. University is the starting point of creating lifelong adventures. Electronics and information technology is a rapidly-developing segment. Students have to pick up the technological advancement very fast within the extremely short cycle of the products in order to keep up with the trend. Keeping innovative ideas all the time is a bit tiring somehow. That is why we need passions to compensate for it.
