# **z** Transform

Chapter Intended Learning Outcomes:

- (i) Understanding the relationship between z transform and the Fourier transform for discrete-time signals
- (ii) Understanding the characteristics and properties of z transform
- (iii) Ability to compute z transform and inverse z transform
- (iv) Ability to apply z transform for analyzing linear time-invariant (LTI) systems

H. C. So Page 1 Semester B 2024-2025

#### **Definition**

The z transform of x[n], denoted by X(z), is defined as:

$$X(z) = \sum_{n=-\infty}^{\infty} x[n]z^{-n}$$
 (5.1)

where z is a continuous complex variable.

# Relationship with Fourier Transform

Employing (4.2), we construct the continuous-time sampled signal  $x_s(t)$  with a sampling interval of T from x[n]:

$$x_s(t) = \sum_{n = -\infty}^{\infty} x[n]\delta(t - nT)$$
 (5.2)

H. C. So Page 2 Semester B 2024-2025

Taking Fourier transform of  $x_s(t)$  with using properties of  $\delta(t)$ :

$$X_{s}(j\Omega) = \int_{-\infty}^{\infty} x_{s}(t)e^{-j\Omega t}dt = \int_{-\infty}^{\infty} \sum_{n=-\infty}^{\infty} x[n]\delta(t-nT)e^{-j\Omega t}dt$$
$$= \sum_{n=-\infty}^{\infty} x[n]e^{-j\Omega nT}$$
(5.3)

Defining  $\omega = \Omega T$  as the discrete-time frequency parameter and writing  $X_s(j\Omega)$  as  $X(e^{j\omega})$ , (5.3) becomes

$$X(e^{j\omega}) = \sum_{n=-\infty}^{\infty} x[n]e^{-j\omega n}$$
 (5.4)

which is known as discrete-time Fourier transform (DTFT) or Fourier transform of discrete-time signals

 $X(e^{j\omega})$  is periodic with period  $2\pi$ :

$$X(e^{j\omega}) = \sum_{n = -\infty}^{\infty} x[n]e^{-j\omega n} = \sum_{n = -\infty}^{\infty} x[n]e^{-j(\omega + 2k\pi)n} = X(e^{j(\omega + 2k\pi)}) \quad \text{(5.5)}$$

where k is any integer. Since z is a continuous complex variable, we can write

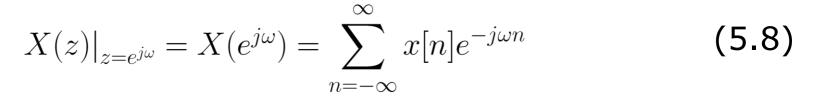

$$z = re^{j\omega} \tag{5.6}$$

where r = |z| > 0 is magnitude and  $\omega = \angle(z)$  is angle of z. Employing (5.6), the z transform is:

$$X(z)|_{z=re^{j\omega}} = X(re^{j\omega}) = \sum_{n=-\infty}^{\infty} \left(x[n]r^{-n}\right)e^{-j\omega n}$$
 (5.7)

which is equal to the DTFT of  $x[n]r^{-n}$ . When r=1 or  $z=e^{j\omega}$ , (5.7) and (5.4) are identical:

H. C. So Page 4 Semester B 2024-2025

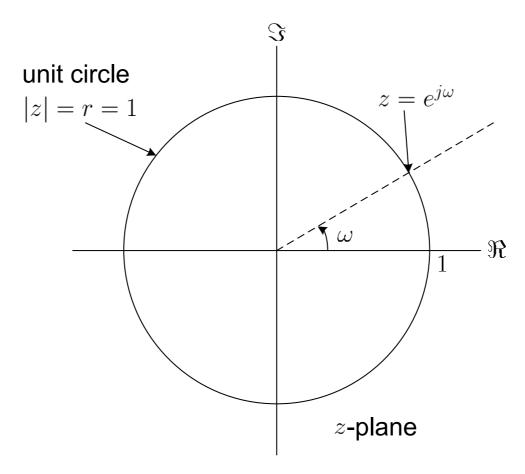

Fig.5.1: Relationship between X(z) and  $X(e^{j\omega})$  on the z-plane

H. C. So Page 5 Semester B 2024-2025

# Region of Convergence (ROC)

ROC indicates when z transform of a sequence converges Generally there exists some z such that

$$|X(z)| = \left| \sum_{n = -\infty}^{\infty} x[n] z^{-n} \right| \to \infty$$
 (5.9)

where the z transform does not converge

The set of values of z for which X(z) converges or

$$|X(z)| = \left| \sum_{n = -\infty}^{\infty} x[n] z^{-n} \right| \le \sum_{n = -\infty}^{\infty} \left| x[n] z^{-n} \right| < \infty$$
 (5.10)

is called the ROC, which must be specified along with X(z) in order for the z transform to be complete

Assuming that x[n] is of infinite length, we decompose X(z):

$$X(z) = X_{-}(z) + X_{+}(z)$$
 (5.11)

where

$$X_{-}(z) = \sum_{n=-\infty}^{-1} x[n]z^{-n} = \sum_{m=1}^{\infty} x[-m]z^{m}$$
 (5.12)

and

$$X_{+}(z) = \sum_{n=0}^{\infty} x[n]z^{-n}$$
 (5.13)

Let  $f_n(z) = x[n]z^{-n}$ ,  $X_+(z)$  is expanded as:

$$X_{+}(z) = x[0]z^{-0} + x[1]z^{-1} + \dots + x[n]z^{-n} + \dots$$
  
=  $f_{0}(z) + f_{1}(z) + \dots + f_{n}(z) + \dots$  (5.14)

H. C. So Page 7 Semester B 2024-2025

According to the ratio test, convergence of  $X_{+}(z)$  requires

$$\lim_{n\to\infty} \left| \frac{f_{n+1}(z)}{f_n(z)} \right| < 1 \tag{5.15}$$

Let  $\lim_{n \to \infty} |x[n+1]/x[n]| = R_+ > 0$ .  $X_+(z)$  converges if

$$\lim_{n \to \infty} \left| \frac{x[n+1]z^{-n-1}}{x[n]z^{-n}} \right| = \lim_{n \to \infty} \left| \frac{x[n+1]}{x[n]} \right| |z^{-1}| < 1$$

$$\Rightarrow |z| > \lim_{n \to \infty} \left| \frac{x[n+1]}{x[n]} \right| = R_{+}$$
(5.16)

That is, the ROC for  $X_+(z)$  is  $|z| > R_+$ .

Let  $\lim_{m \to \infty} |x[-m]/x[-m-1]| = R_- > 0$ .  $X_-(z)$  converges if

$$\lim_{m \to \infty} \left| \frac{x[-m-1]z^{m+1}}{x[-m]z^m} \right| = \lim_{m \to \infty} \left| \frac{x[-m-1]}{x[-m]} \right| |z| < 1$$

$$\Rightarrow |z| < \lim_{m \to \infty} \left| \frac{x[-m]}{x[-m]} \right| = R_{-}$$
(5.17)

As a result, the ROC for  $X_{-}(z)$  is  $|z| < R_{-}$ 

Combining the results, the ROC for X(z) is  $R_+ < |z| < R_-$ :

- ROC is a ring when  $R_+ < R_-$
- No ROC if  $R_- < R_+$  and X(z) does not exist

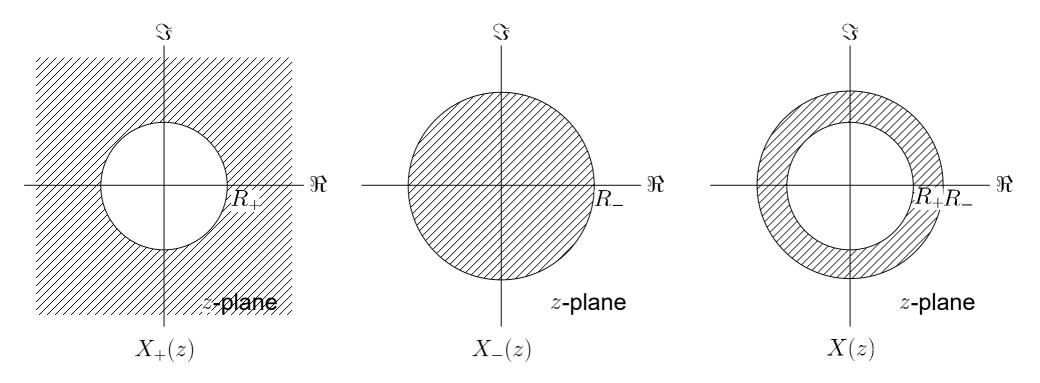

Fig.5.2: ROCs for  $X_+(z)$ ,  $X_-(z)$  and X(z)

# Poles and Zeros

Values of z for which X(z) = 0 are the zeros of X(z)

Values of z for which  $X(z) = \pm \infty$  are the poles of X(z)

In many real-world applications, X(z) is represented as a rational function:

$$X(z) = \frac{P(z)}{Q(z)} = \frac{\sum_{k=0}^{M} b_k z^k}{\sum_{k=0}^{N} a_k z^k}$$
 (5.18)

Factorizing P(z) and Q(z), (5.18) can be written as

$$X(z) = \frac{b_0(z - d_1)(z - d_2) \cdots (z - d_M)}{a_0(z - c_1)(z - c_2) \cdots (z - c_N)}$$
(5.19)

How many poles and zeros in (5.18)? What are they?

H. C. So Page 11 Semester B 2024-2025

#### Example 5.1

Determine the z transform of  $x[n] = a^n u[n]$  where u[n] is the unit step function. Then determine the condition when the DTFT of x[n] exists.

Using (5.1) and (3.3), we have

$$X(z) = \sum_{n = -\infty}^{\infty} a^n u[n] z^{-n} = \sum_{n = 0}^{\infty} (az^{-1})^n$$

According to (5.10), X(z) converges if

$$\sum_{n=0}^{\infty} \left| az^{-1} \right|^n < \infty$$

Applying the ratio test, the convergence condition is

$$\left|az^{-1}\right| < 1 \Leftrightarrow |z| > |a|$$

Note that we cannot write |z| > a because a may be complex

For |z| > |a|, X(z) is computed as

$$X(z) = \sum_{n=0}^{\infty} (az^{-1})^n = \frac{1 - (az^{-1})^{\infty}}{1 - az^{-1}} = \frac{1}{1 - az^{-1}} = \frac{z}{z - a}$$

Together with the ROC, the z transform of  $x[n] = a^n u[n]$  is:

$$X(z) = \frac{z}{z - a}, \quad |z| > |a|$$

It is clear that X(z) has a zero at z=0 and a pole at z=a. Using (5.8), we substitute  $z=e^{j\omega}$  to obtain

$$X(e^{j\omega}) = \frac{e^{j\omega}}{e^{j\omega} - a}, \quad |e^{j\omega}| = 1 > |a|$$

As a result, the existence condition for DTFT of x[n] is |a| < 1.

H. C. So Page 13 Semester B 2024-2025

Otherwise, its DTFT does not exist. In general, the DTFT  $X(e^{j\omega})$  exists if its ROC includes the unit circle. If |z| > |a| includes |z| = 1, |a| < 1 is required.

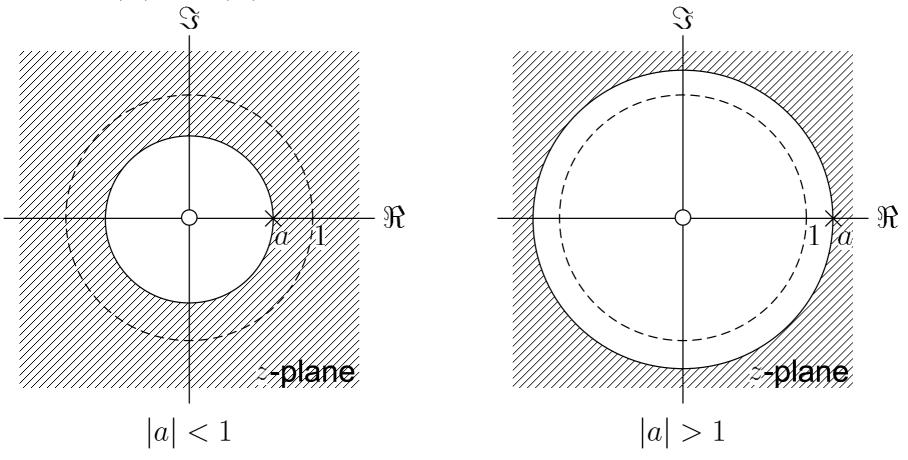

Fig.5.3: ROCs for |a| < 1 and |a| > 1 when  $x[n] = a^n u[n]$ 

H. C. So Page 14 Semester B 2024-2025

#### Example 5.2

Determine the z transform of  $x[n]=-a^nu[-n-1]$  . Then determine the condition when the DTFT of x[n] exists.

Using (5.1) and (3.3), we have

$$X(z) = \sum_{n = -\infty}^{-1} -a^n z^{-n} = -\sum_{m=1}^{\infty} a^{-m} z^m = -\sum_{m=1}^{\infty} \left(a^{-1} z\right)^m$$

Similar to Example 5.1, X(z) converges if  $|a^{-1}z| < 1$  or |z| < |a|, which aligns with the ROC for  $X_{-}(z)$  in (5.17). This gives

$$X(z) = -\sum_{m=1}^{\infty} \left( a^{-1}z \right)^m = -\frac{a^{-1}z \left( 1 - \left( a^{-1}z \right)^{\infty} \right)}{1 - a^{-1}z} = -\frac{a^{-1}z}{1 - a^{-1}z} = \frac{z}{z - a}$$

Together with ROC, the z transform of  $x[n] = -a^n u[-n-1]$  is:

$$X(z) = \frac{z}{z - a}, \quad |z| < |a|$$

H. C. So Page 15 Semester B 2024-2025

Using (5.8), we substitute  $z=e^{j\omega}$  to obtain

$$X(e^{j\omega}) = \frac{e^{j\omega}}{e^{j\omega} - a}, \quad |e^{j\omega}| = 1 < |a|$$

As a result, the existence condition for DTFT of x[n] is |a| > 1.

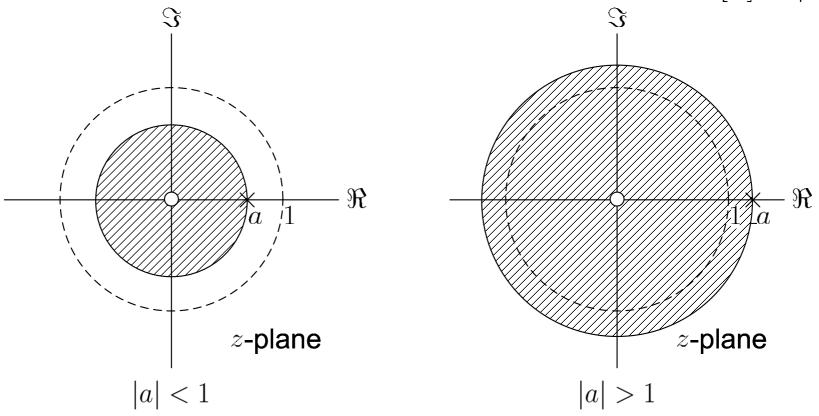

Fig.5.4: ROCs for |a| < 1 and |a| > 1 when  $x[n] = -a^n u[-n-1]$ 

H. C. So Page 16 Semester B 2024-2025

# Example 5.3

Determine the z transform of  $x[n] = a^n u[n] + b^n u[-n-1]$  where |a| < |b|.

Employing the results in Examples 5.1 and 5.2, we have

$$X(z) = \frac{1}{1 - az^{-1}} + \left(-\frac{1}{1 - bz^{-1}}\right), \quad |z| > |a| \quad \text{and} \quad |z| < |b|$$

$$= \frac{(a - b)z^{-1}}{(1 - az^{-1})(1 - bz^{-1})}$$

$$= \frac{(a - b)z}{(z - a)(z - b)}, \quad |a| < |z| < |b|$$

Note that its ROC agrees with Fig.5.2.

# What are the pole(s) and zero(s) of X(z)?

# Example 5.4

Determine the z transform of  $x[n] = \delta[n+1]$ .

Using (5.1) and (3.2), we have

$$X(z) = \sum_{n=-\infty}^{\infty} \delta[n+1]z^{-n} = z$$

# Example 5.5

Determine the z transform of x[n] which has the form of:

$$x[n] = \begin{cases} a^n, & 0 \le n \le N - 1 \\ 0, & \text{otherwise} \end{cases}$$

Using (5.1), we have

$$X(z) = \sum_{n=0}^{N-1} (az^{-1})^n = \frac{1 - (az^{-1})^N}{1 - az^{-1}} = \frac{1}{z^{N-1}} \frac{z^N - a^N}{z - a}$$

# What are the ROCs in Examples 5.4 and 5.5?

# Finite-Duration and Infinite-Duration Sequences

Finite-duration sequence: values of x[n] are nonzero only for a finite time interval

Otherwise, x[n] is called an infinite-duration sequence:

- Right-sided: if x[n] = 0 for  $n < N_+ < \infty$  where  $N_+$  is an integer (e.g.,  $x[n] = a^n u[n]$  with  $N_+ = 0$ ;  $x[n] = a^n u[n-10]$  with  $N_+ = 10$ ;  $x[n] = a^n u[n+10]$  with  $N_+ = -10$ )
- Left-sided: if x[n]=0 for  $n>N_->-\infty$  where  $N_-$  is an integer (e.g.,  $x[n]=-a^nu[-n-1]$  with  $N_-=-1$ )
- Two-sided: neither right-sided nor left-sided (e.g., Example 5.3)

H. C. So Page 19 Semester B 2024-2025

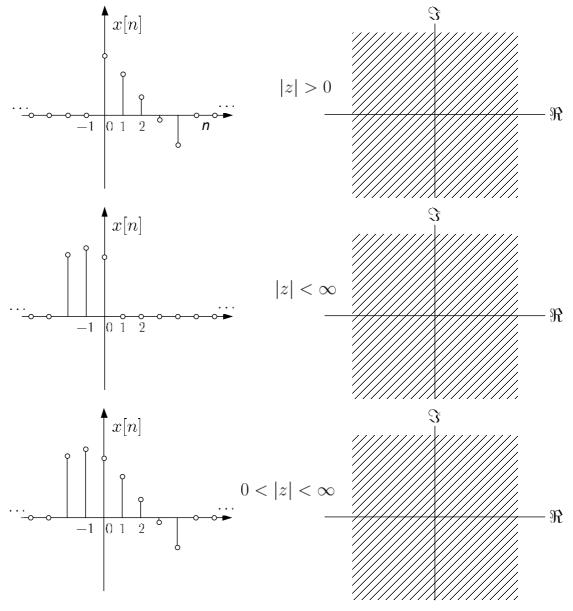

Fig.5.5: Finite-duration sequences

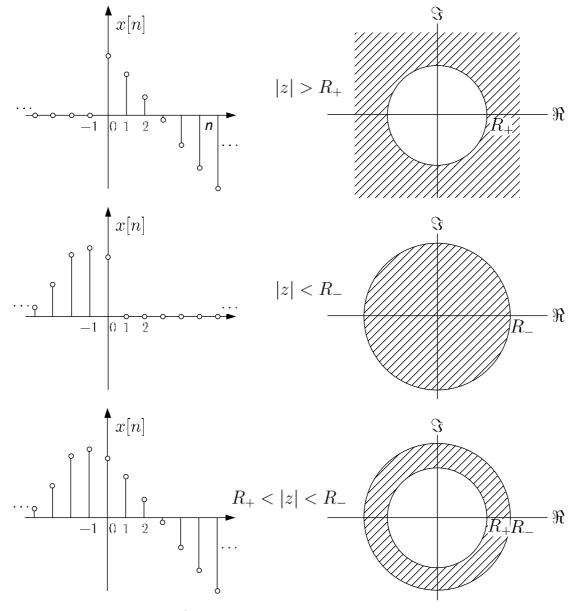

Fig. 5.6: Infinite-duration sequences

Sequence	Transform	ROC
$\delta[n]$	1	All $z$
$\delta[n-m]$	$z^{-m}$	$ z  > 0$ , $m > 0$ ; $ z  < \infty$ , $m < 0$
	11	z  >  a
$a^n u[n]$	$1 - az^{-1}$	
$-a^n u[-n-1]$	$1 - az^{-1}$	z  <  a
	$az^{-1}$	
$na^nu[n]$	$\frac{\overline{(1-az^{-1})^2}}{az^{-1}}$	z  >  a
	$az^{-1}$	
$-na^nu[-n-1]$	$(1-az^{-1})^2$	z  <  a
	$1 - a\cos(b)z^{-1}$	
$a^n \cos(bn)u[n]$	$1 - 2a\cos(b)z^{-1} + a^2z^{-2}$	z  >  a
	$a\sin(b)z^{-1}$	
$a^n \sin(bn)u[n]$	$1 - 2a\cos(b)z^{-1} + a^2z^{-2}$	z  >  a

Table 5.1: z transforms for common sequences

Eight ROC properties are:

- P1. There are four possible shapes for ROC, namely, the entire region except possibly z=0 and/or  $z=\infty$ , a ring, or inside or outside a circle in the z-plane centered at the origin (e.g., Figures 5.5 and 5.6)
- P2. The DTFT of a sequence x[n] exists if and only if the ROC of the z transform of x[n] includes the unit circle (e.g., Examples 5.1 and 5.2)
- P3: The ROC cannot contain any poles (e.g., Examples 5.1 to 5.5)
- P4: When x[n] is a finite-duration sequence, the ROC is the entire z-plane except possibly z=0 and/or  $z=\pm\infty$  (e.g., Examples 5.4 and 5.5)

H. C. So Page 23 Semester B 2024-2025

P5: When x[n] is a right-sided sequence, the ROC is of the form  $|z| > |p_{\max}|$  where  $p_{\max}$  is the pole with the largest magnitude in X(z) (e.g., Example 5.1)

P6: When x[n] is a left-sided sequence, the ROC is of the form  $|z| < |p_{\min}|$  where  $p_{\min}$  is the pole with the smallest magnitude in X(z) (e.g., Example 5.2)

P7: When x[n] is a two-sided sequence, the ROC is of the form  $|p_a| < |z| < |p_b|$  where  $p_a$  and  $p_b$  are two poles with the successive magnitudes in X(z) such that  $|p_a| < |p_b|$  (e.g., Example 5.3)

P8: The ROC must be a connected region

# Example 5.6

A z transform X(z) contains three poles, namely, a, b and c with |a| < |b| < |c|. Determine all possible ROCs.

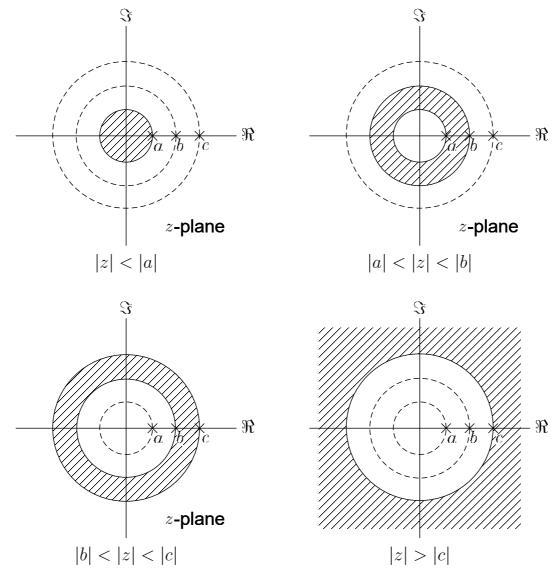

Fig.5.7: ROC possibilities for three poles

# What are other possible ROCs?

# Properties of z Transform

# 1. Linearity

Let  $(x_1[n], X_1(z))$  and  $(x_2[n], X_2(z))$  be two z transform pairs with ROCs  $\mathcal{R}_{x_1}$  and  $\mathcal{R}_{x_2}$ , respectively, we have

$$ax_1[n] + bx_2[n] \leftrightarrow aX_1(z) + bX_2(z)$$
 (5.20)

Its ROC is denoted by  $\mathcal{R}$ , which includes  $\mathcal{R}_{x_1} \cap \mathcal{R}_{x_2}$  where  $\cap$  is the intersection operator. That is,  $\mathcal{R}$  contains at least the intersection of  $\mathcal{R}_{x_1}$  and  $\mathcal{R}_{x_2}$ .

# Example 5.7

Determine the z transform of y[n] which is expressed as:

$$y[n] = x_1[n] + x_2[n]$$

where  $x_1[n] = (0.2)^n u[n]$  and  $x_2[n] = (-0.3)^n u[n]$ .

From Table 5.1, the z transforms of  $x_1[n]$  and  $x_2[n]$  are:

$$x_1[n] = (0.2)^n u[n] \leftrightarrow \frac{1}{1 - 0.2z^{-1}}, \quad |z| > 0.2$$

and

$$x_2[n] = (-0.3)^n u[n] \leftrightarrow \frac{1}{1 + 0.3z^{-1}}, \quad |z| > 0.3$$

According to the linearity property, the z transform of y[n] is

$$Y(z) = \frac{1}{1 - 0.2z^{-1}} + \frac{1}{1 + 0.3z^{-1}}, \quad |z| > 0.3$$

# Why the ROC is |z|>0.3 instead of |z|>0.2?

# 2. Time Shifting

A time-shift of  $n_0$  in x[n] causes a multiplication of  $z^{-n_0}$  in X(z)

$$x[n-n_0] \leftrightarrow z^{-n_0} X(z) \tag{5.21}$$

The ROC for  $x[n-n_0]$  is basically identical to that of X(z) except for the possible addition or deletion of z=0 or  $z=\infty$ 

H. C. So Page 27 Semester B 2024-2025

# Example 5.8

Find the z transform of x[n] which has the form of:

$$x[n] = a^{n-1}u[n-1]$$

Employing the time-shifting property with  $n_0 = 1$  and:

$$a^n u[n] \leftrightarrow \frac{1}{1 - az^{-1}}, \quad |z| > |a|$$

we easily obtain

$$a^{n-1}u[n-1] \leftrightarrow z^{-1} \cdot \frac{1}{1-az^{-1}} = \frac{z^{-1}}{1-az^{-1}}, \quad |z| > |a|$$

Note that using (5.1) with |z| > |a| also produces the same result but this approach is less efficient:

$$X(z) = \sum_{n=1}^{\infty} a^{n-1} z^{-n} = a^{-1} \sum_{n=1}^{\infty} \left( az^{-1} \right)^n = a^{-1} \frac{az^{-1} \left[ 1 - \left( az^{-1} \right)^{\infty} \right]}{1 - az^{-1}} = \frac{z^{-1}}{1 - az^{-1}}$$

H. C. So Page 28 Semester B 2024-2025

# 3. Multiplication by an Exponential Sequence (Modulation)

If we multiply x[n] by  $z_0^n$  in the time domain, the variable z will be changed to  $z/z_0$  in the z transform domain. That is:

$$z_0^n x[n] \leftrightarrow X(z/z_0) \tag{5.22}$$

If the ROC for x[n] is  $R_+ < |z| < R_-$ , the ROC for  $z_0^n x[n]$  is  $|z_0|R_+ < |z| < |z_0|R_-$ 

# Example 5.9

With the use of the following z transform pair:

$$u[n] \leftrightarrow \frac{1}{1 - z^{-1}}, \quad |z| > 1$$

Find the z transform of x[n] which has the form of:

$$x[n] = a^n \cos(bn)u[n]$$

Noting that  $cos(bn) = (e^{jbn} + e^{-jbn})/2$ , x[n] can be written as:

$$x[n] = \frac{1}{2} (ae^{jb})^n u[n] + \frac{1}{2} (ae^{-jb})^n u[n]$$

By means of the modulation property of (5.22) with the substitution of  $z_0 = ae^{jb}$  and  $z_0 = ae^{-jb}$ , we obtain:

$$\frac{1}{2} \left( ae^{jb} \right)^n u[n] \leftrightarrow \frac{1}{2} \frac{1}{1 - (z/(ae^{jb}))^{-1}} = \frac{1}{2} \frac{1}{1 - ae^{jb}z^{-1}}, \quad |z| > |a|$$

and

$$\frac{1}{2} \left( ae^{-jb} \right)^n u[n] \leftrightarrow \frac{1}{2} \frac{1}{1 - (z/(ae^{-jb}))^{-1}} = \frac{1}{2} \frac{1}{1 - ae^{-jb}z^{-1}}, \quad |z| > |a|$$

By means of the linearity property, it follows that

$$X(z) = \frac{1}{21 - ae^{jb}z^{-1}} + \frac{1}{21 - ae^{-jb}z^{-1}} = \frac{1 - a\cos(b)z^{-1}}{1 - 2a\cos(b)z^{-1} + a^2z^{-2}}, |z| > |a|$$

which agrees with Table 5.1.

H. C. So Page 30 Semester B 2024-2025

#### 4. Differentiation

Differentiating X(z) with respect to z corresponds to multiplying x[n] by n in the time domain:

$$nx[n] \leftrightarrow -z \frac{dX(z)}{dz} \tag{5.23}$$

The ROC for nx[n] is basically identical to that of X(z) except for the possible addition or deletion of z=0 or  $z=\infty$ 

# Example 5.10

Determine the z transform of  $x[n] = na^nu[n]$ .

Since

$$a^n u[n] \leftrightarrow \frac{1}{1 - az^{-1}}, \quad |z| > |a|$$

and

$$\frac{d}{dz}\left(\frac{1}{1-az^{-1}}\right) = \frac{d\left(1-az^{-1}\right)^{-1}}{d\left(1-az^{-1}\right)} \cdot \frac{d\left(1-az^{-1}\right)}{dz} = -\frac{az^{-2}}{(1-az^{-1})^2}$$

By means of the differentiation property, we have

$$na^n u[n] \leftrightarrow -z \cdot -\frac{az^{-2}}{(1-az^{-1})^2} = \frac{az^{-1}}{(1-az^{-1})^2}, \quad |z| > |a|$$

which agrees with Table 5.1.

# 5. Conjugation

The z transform pair for  $x^*[n]$  is:

$$x^*[n] \leftrightarrow X^*(z^*) \tag{5.24}$$

The ROC for  $x^*[n]$  is identical to that of x[n]

#### 6. Time Reversal

The z transform pair for x[-n] is:

$$x[-n] \leftrightarrow X(z^{-1}) \tag{5.25}$$

If the ROC for x[n] is  $R_+ < |z| < R_-$ , the ROC for x[-n] is  $1/R_- < |z| < 1/R_+$ 

# Example 5.11

Determine the z transform of  $x[n] = -na^{-n}u[-n]$ 

Using Example 5.10:

$$na^n u[n] \leftrightarrow \frac{az^{-1}}{(1-az^{-1})^2}, \quad |z| > |a|$$

and from the time reversal property:

$$X(z) = \frac{az}{(1 - az)^2} = \frac{a^{-1}z^{-1}}{(1 - a^{-1}z^{-1})^2}, \quad |z| < |a^{-1}|$$

H. C. So Page 33 Semester B 2024-2025

#### 7. Convolution

Let  $(x_1[n], X_1(z))$  and  $(x_2[n], X_2(z))$  be two z transform pairs with ROCs  $\mathcal{R}_{x_1}$  and  $\mathcal{R}_{x_2}$ , respectively. Then we have:

$$x_1[n] \otimes x_2[n] \leftrightarrow X_1(z)X_2(z) \tag{5.26}$$

and its ROC includes  $\mathcal{R}_{x_1} \cap \mathcal{R}_{x_2}$ .

The proof is given as follows.

Let

$$y[n] = x_1[n] \otimes x_2[n] = \sum_{k=-\infty}^{\infty} x_1[k]x_2[n-k]$$
 (5.27)

H. C. So Page 34 Semester B 2024-2025

# With the use of the time shifting property, Y(z) is:

$$Y(z) = \sum_{n=-\infty}^{\infty} \left[ \sum_{k=-\infty}^{\infty} x_1[k] x_2[n-k] \right] z^{-n}$$

$$= \sum_{k=-\infty}^{\infty} x_1[k] \left[ \sum_{n=-\infty}^{\infty} x_2[n-k] z^{-n} \right]$$

$$= \sum_{k=-\infty}^{\infty} x_1[k] X_2(z) z^{-k}$$

$$= X_1(z) X_2(z)$$
(5.28)

#### Inverse z Transform

Inverse z transform corresponds to finding x[n] given X(z) and its ROC

The z transform and inverse z transform are one-to-one mapping provided that the ROC is given:

$$x[n] \leftrightarrow X(z)$$
 (5.29)

There are 4 commonly used techniques to evaluate the inverse z transform. They are

- 1. Inspection
- 2. Partial Fraction Expansion
- 3. Power Series Expansion
- 4. Cauchy Integral Theorem

# **Inspection**

When we are familiar with certain transform pairs, we can do the inverse  $\boldsymbol{z}$  transform by inspection

### Example 5.12

Determine the inverse z transform of X(z) which is expressed as:

$$X(z) = \frac{z}{2z - 1}, \quad |z| > 0.5$$

We first rewrite X(z) as:

$$X(z) = \frac{0.5}{1 - 0.5z^{-1}}$$

# Making use of the following transform pair in Table 5.1:

$$a^n u[n] \leftrightarrow \frac{1}{1 - az^{-1}}, \quad |z| > |a|$$

and putting a = 0.5, we have:

$$\frac{0.5}{1 - 0.5z^{-1}} \leftrightarrow 0.5(0.5)^n u[n]$$

By inspection, the inverse z transform is:

$$x[n] = (0.5)^{n+1}u[n]$$

### **Partial Fraction Expansion**

It is useful when X(z) is a rational function in  $z^{-1}$ :

$$X(z) = rac{\displaystyle\sum_{k=0}^{M} b_k z^{-k}}{\displaystyle\sum_{k=0}^{N} a_k z^{-k}}$$
 (5.30)

For pole and zero determination, it is advantageous to multiply  $z^{M+N}$  to both numerator and denominator:

$$X(z) = rac{z^N \sum_{k=0}^{M} b_k z^{M-k}}{z^M \sum_{k=0}^{N} a_k z^{N-k}}$$
 (5.31)

H. C. So Page 39 Semester B 2024-2025

- When M > N, there are (M N) pole(s) at z = 0
- When M < N, there are (N M) zero(s) at z = 0

To obtain the partial fraction expansion from (5.30), the first step is to determine the N nonzero poles,  $c_1, c_2, \cdots, c_N$ 

There are 4 cases to be considered:

Case 1: M < N and all poles are of first order

For first-order poles, all  $\{c_k\}$  are distinct. X(z) is:

$$X(z) = \sum_{k=1}^{N} \frac{A_k}{1 - c_k z^{-1}}$$
 (5.32)

For each first-order term of  $A_k/\left(1-c_kz^{-1}\right)$ , its inverse z transform can be easily obtained by inspection

H. C. So Page 40 Semester B 2024-2025

Multiplying both sides by  $\left(1-c_kz^{-1}\right)$  and evaluating for  $z=c_k$ 

$$A_k = (1 - c_k z^{-1}) X(z) \Big|_{z=c_k}$$
 (5.33)

An illustration for computing  $A_1$  with N=2>M is:

$$X(z) = \frac{A_1}{1 - c_1 z^{-1}} + \frac{A_2}{1 - c_2 z^{-1}}$$

$$\Rightarrow \left(1 - c_1 z^{-1}\right) X(z) = A_1 + \frac{A_2 \left(1 - c_1 z^{-1}\right)}{1 - c_2 z^{-1}}$$
(5.34)

Substituting  $z = c_1$ , we get  $A_1$ 

In summary, three steps are:

- Find poles
- Find  $\{A_k\}$
- Perform inverse z transform for the fractions by inspection

H. C. So Page 41 Semester B 2024-2025

Find the pole and zero locations of H(z):

$$H(z) = -\frac{1 + 0.1z^{-1}}{1 - 2.05z^{-1} + z^{-2}}$$

Then determine the inverse z transform of H(z).

We first multiply  $z^2$  to both numerator and denominator polynomials to obtain:

$$H(z) = -\frac{z(z+0.1)}{z^2 - 2.05z + 1}$$

Apparently, there are two zeros at z=0 and z=-0.1. On the other hand, by solving the quadratic equation at the denominator polynomial, the poles are determined as z=0.8 and z=1.25.

According to (5.32), we have:

$$H(z) = \frac{A_1}{1 - 0.8z^{-1}} + \frac{A_2}{1 - 1.25z^{-1}}$$

Employing (5.33),  $A_1$  is calculated as:

$$A_1 = (1 - 0.8z^{-1}) H(z)|_{z=0.8} = -\frac{1 + 0.1z^{-1}}{1 - 1.25z^{-1}}|_{z=0.8} = 2$$

Similarly,  $A_2$  is found to be -3. As a result, the partial fraction expansion for H(z) is

$$H(z) = \frac{2}{1 - 0.8z^{-1}} - \frac{3}{1 - 1.25z^{-1}}$$

As the ROC is not specified, we investigate all possible scenarios, namely, |z| > 1.25, 0.8 < |z| < 1.25, and |z| < 0.8.

H. C. So Page 43 Semester B 2024-2025

For |z| > 1.25, we notice that

$$(0.8)^n u[n] \leftrightarrow \frac{1}{1 - 0.8z^{-1}}, \quad |z| > 0.8$$

and

$$(1.25)^n u[n] \leftrightarrow \frac{1}{1 - 1.25z^{-1}}, \quad |z| > 1.25$$

where both ROCs agree with |z| > 1.25. Combining the results, the inverse z transform h[n] is:

$$h[n] = (2(0.8)^n - 3(1.25)^n) u[n]$$

which is a right-sided sequence and aligns with P5.

For 0.8 < |z| < 1.25, we make use of

$$(0.8)^n u[n] \leftrightarrow \frac{1}{1 - 0.8z^{-1}}, \quad |z| > 0.8$$

and

$$-(1.25)^n u[-n-1] \leftrightarrow \frac{1}{1-1.25z^{-1}}, \quad |z| < 1.25$$

where both ROCs agree with 0.8 < |z| < 1.25. This implies:

$$h[n] = 2(0.8)^n u[n] + 3(1.25)^n u[-n-1]$$

which is a two-sided sequence and aligns with P7.

Finally, for |z| < 0.8:

$$-(0.8)^n u[-n-1] \leftrightarrow \frac{1}{1-0.8z^{-1}}, \quad |z| < 0.8$$

and

$$-(1.25)^n u[-n-1] \leftrightarrow \frac{1}{1-1.25z^{-1}}, \quad |z| < 1.25$$

where both ROCs agree with |z| < 0.8. As a result, we have:

$$h[n] = (-2(0.8)^n + 3(1.25)^n) u[-n-1]$$

which is a left-sided sequence and aligns with P6.

Suppose h[n] is the impulse response of a discrete-time LTI system. Recall (3.15) and (3.16):

$$h[n] = 0, \quad n < 0$$

and

$$\sum_{n=-\infty}^{\infty} |h[n]| < \infty$$

The three possible impulse responses:

- $h[n] = (2(0.8)^n (1.25)^n) u[n]$  is the impulse response of a causal but unstable system
- $h[n] = 2(0.8)^n u[n] + (1.25)^n u[-n-1]$  corresponds to a noncausal but stable system
- $h[n] = (-2(0.8)^n + (1.25)^n) u[-n-1]$  is noncausal and unstable

# Which of the h[n] has/have DTFT?

Case 2:  $M \ge N$  and all poles are of first order

In this case, X(z) can be expressed as:

$$X(z) = \sum_{l=0}^{M-N} B_l z^{-l} + \sum_{k=1}^{N} \frac{A_k}{1 - c_k z^{-1}}$$
 (5.35)

- $B_l$  are obtained by long division of the numerator by the denominator, with the division process terminating when the remainder is of lower degree than the denominator
- $A_k$  can be obtained using (5.33).

# Example 5.14

Determine x[n] which has z transform of the form:

$$X(z) = \frac{4 - 2z^{-1} + z^{-2}}{1 - 1.5z^{-1} + 0.5z^{-2}}, \quad |z| > 1$$

The poles are easily determined as z = 0.5 and z = 1

According to (5.35) with M=N=2:

$$X(z) = B_0 + \frac{A_1}{1 - 0.5z^{-1}} + \frac{A_2}{1 - z^{-1}}$$

The value of  $B_0$  is found by dividing the numerator polynomial by the denominator polynomial as follows:

$$0.5z^{-2} - 1.5z^{-1} + 1)\frac{2}{z^{-2} - 2z^{-1} + 4}$$

$$\frac{z^{-2} - 3z^{-1} + 2}{z^{-1} + 2}$$

That is,  $B_0 = 2$ . Thus X(z) is expressed as

$$X(z) = 2 + \frac{2 + z^{-1}}{(1 - 0.5z^{-1})(1 - z^{-1})} = 2 + \frac{A_1}{1 - 0.5z^{-1}} + \frac{A_2}{1 - z^{-1}}$$

H. C. So Page 48 Semester B 2024-2025

# According to (5.33), $A_1$ and $A_2$ are calculated as

$$A_1 = \frac{4 - 2z^{-1} + z^{-2}}{1 - z^{-1}} \bigg|_{z=0.5} = -4$$

and

$$A_2 = \frac{4 - 2z^{-1} + z^{-2}}{1 - 0.5z^{-1}} \bigg|_{z=1} = 6$$

With |z| > 1:

$$\delta[n] \leftrightarrow 1$$

$$(0.5)^n u[n] \leftrightarrow \frac{1}{1 - 0.5z^{-1}}, \quad |z| > 0.5$$

and

$$u[n] \leftrightarrow \frac{1}{1 - z^{-1}}, \quad |z| > 1$$

the inverse z transform x[n] is:

$$x[n] = 2\delta[n] - 4(0.5)^n u[n] + 6u[n]$$

Case 3: M < N with multiple-order pole(s)

If X(z) has a s-order pole at  $z = c_i$  with  $s \ge 2$ , this means that there are s repeated poles with the same value of  $c_i$ . X(z) is:

$$X(z) = \sum_{k=1, k \neq i}^{N} \frac{A_k}{1 - c_k z^{-1}} + \sum_{m=1}^{s} \frac{C_m}{\left(1 - c_i z^{-1}\right)^m}$$
 (5.36)

- When there are two or more multiple-order poles, we include a component like the second term for each corresponding pole
- $A_k$  can be computed according to (5.33)
- $C_m$  can be calculated from:

$$C_m = \frac{1}{(s-m)!(-c_i)^{s-m}} \cdot \frac{d^{s-m}}{dw^{s-m}} \left[ (1-c_iw)^s X(w^{-1}) \right]_{w=c_i^{-1}}$$
(5.37)

H. C. So Page 50 Semester B 2024-2025

Determine the partial fraction expansion for X(z):

$$X(z) = \frac{4}{(1+z^{-1})(1-z^{-1})^2}$$

It is clear that X(z) corresponds to Case 3 with N=3>M and one second-order pole at z=1. Hence X(z) is:

$$X(z) = \frac{A_1}{1+z^{-1}} + \frac{C_1}{1-z^{-1}} + \frac{C_2}{(1-z^{-1})^2}$$

Employing (5.33),  $A_1$  is:

$$A_1 = \frac{4}{(1-z^{-1})^2} \bigg|_{z=-1} = 1$$

# Applying (5.37), $C_1$ is:

$$C_{1} = \frac{1}{(2-1)!(-1)^{2-1}} \cdot \frac{d}{dw} \left[ (1-1 \cdot w)^{2} \frac{4}{(1+w)(1-w)^{2}} \right] \Big|_{w=1}$$

$$= -\frac{d}{dw} \frac{4}{1+w} \Big|_{w=1}$$

$$= \frac{4}{(1+w)^{2}} \Big|_{w=1}$$

$$= 1$$

and

$$C_{2} = \frac{1}{(2-2)!(-1)^{2-2}} \cdot \left[ (1-1 \cdot w)^{2} \frac{4}{(1+w)(1-w)^{2}} \right]_{w=1}^{1}$$

$$= \frac{4}{1+w}|_{w=1}^{1}$$

$$= 2$$

Therefore, the partial fraction expansion for X(z) is

$$X(z) = \frac{1}{1+z^{-1}} + \frac{1}{1-z^{-1}} + \frac{2}{(1-z^{-1})^2}$$

Case 4:  $M \ge N$  with multiple-order pole(s)

This is the most general case and the partial fraction expansion of X(z) is

$$X(z) = \sum_{l=0}^{M-N} B_l z^{-l} + \sum_{k=1, k \neq i}^{N} \frac{A_k}{1 - c_k z^{-1}} + \sum_{m=1}^{s} \frac{C_m}{\left(1 - c_i z^{-1}\right)^m}$$
(5.38)

assuming that there is only one multiple-order pole of order  $s \ge 2$  at  $z = c_i$ . It is easily extended to the scenarios when there are two or more multiple-order poles as in Case 3. The  $A_k$ ,  $B_l$  and  $C_m$  can be calculated as in Cases 1, 2 and 3

H. C. So Page 53 Semester B 2024-2025

## Power Series Expansion

When X(z) is expanded as power series according to (5.1):

$$X(z) = \sum_{n=-\infty}^{\infty} x[n]z^{-n} = \dots + x[-1]z^{1} + x[0] + x[1]z^{-1} + x[2]z^{-2} + \dots$$
 (5.39)

any particular value of x[n] can be determined by finding the coefficient of the appropriate power of  $z^{-1}$ 

## Example 5.16

Determine x[n] which has z transform of the form:

$$X(z) = 2z^{2} (1 - 0.5z^{-1}) (1 + z^{-1}) (1 - z^{-1}), \quad 0 < |z| < \infty$$

Expanding X(z) yields

$$X(z) = 2z^2 - z - 2 + z^{-1}$$

From (5.39), x[n] is deduced as:

$$x[n] = 2\delta[n+2] - \delta[n+1] - 2\delta[n] + \delta[n-1]$$

H. C. So Page 54 Semester B 2024-2025

Determine x[n] whose z transform is given as:

$$X(z) = \log(1 + az^{-1}), \quad |z| > |a|$$

With the use of the power series expansion for  $\log(1 + \lambda)$ :

$$\log(1+\lambda) = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}\lambda^n}{n}, \quad |\lambda| < 1$$

|X(z)| with  $|az^{-1}| < 1$  can be expressed as

$$\log(1 + az^{-1}) = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}a^nz^{-n}}{n}$$

From (5.39), x[n] is deduced as:

$$x[n] = \frac{(-1)^{n+1}a^n}{n}u[n-1]$$

Determine x[n] whose z transform has the form of:

$$X(z) = \frac{1}{1 - az^{-1}}, \quad |z| > |a|$$

With the use of

$$\frac{1}{1-\lambda} = 1 + \lambda + \lambda^2 + \cdots, \quad |\lambda| < 1$$

Carrying out long division in X(z) with  $|az^{-1}| < 1$ :

$$X(z) = 1 + az^{-1} + (az^{-1})^{2} + \cdots$$

From (5.39), x[n] is deduced as:

$$x[n] = a^n u[n]$$

which agrees with Example 5.1 and Table 5.1

Determine x[n] whose z transform has the form of:

$$X(z) = \frac{1}{1 - az^{-1}}, \quad |z| < |a|$$

We first express X(z) as:

$$X(z) = \frac{-a^{-1}z}{-a^{-1}z} \cdot \frac{1}{1 - az^{-1}} = \frac{-a^{-1}z}{1 - a^{-1}z}$$

Carrying out long division in X(z) with  $|a^{-1}z| < 1$ :

$$X(z) = -a^{-1}z \left(1 + a^{-1}z + (a^{-1}z)^2 + \cdots\right)$$

From (5.39), x[n] is deduced as:

$$x[n] = -a^n u[-n-1]$$

which agrees with Example 5.2 and Table 5.1

## Transfer Function of Linear Time-Invariant System

A LTI system can be characterized by the transfer function, which is a z transform expression

Starting with:

$$\sum_{k=0}^{N} a_k y[n-k] = \sum_{k=0}^{M} b_k x[n-k]$$
 (5.40)

Applying z transform on (5.40) with the use of the linearity and time shifting properties, we have

$$Y(z)\sum_{k=0}^{N}a_{k}z^{-k} = X(z)\sum_{k=0}^{M}b_{k}z^{-k}$$
 (5.41)

The transfer function, denoted by H(z), is defined as:

$$H(z) = rac{Y(z)}{X(z)} = rac{\displaystyle\sum_{k=0}^{M} b_k z^{-k}}{\displaystyle\sum_{k=0}^{N} a_k z^{-k}}$$
 (5.42)

The system impulse response h[n] is given by the inverse z transform of H(z) with an appropriate ROC, that is,  $h[n] \leftrightarrow H(z)$ , such that  $y[n] = x[n] \otimes h[n]$ . This suggests that we can first take the z transforms for x[n] and h[n], then multiply X(z) by H(z), and finally perform the inverse z transform of X(z)H(z).

Determine the transfer function for a LTI system whose input x[n] and output y[n] are related by:

$$y[n] = 0.1y[n-1] + x[n] + x[n-1]$$

Applying z transform on the difference equation with the use of the linearity and time shifting properties, H(z) is:

$$Y(z) (1 - 0.1z^{-1}) = X(z) (1 + z^{-1}) \Rightarrow H(z) = \frac{Y(z)}{X(z)} = \frac{1 + z^{-1}}{1 - 0.1z^{-1}}$$

Note that there are two ROC possibilities, namely, |z| > 0.1 and |z| < 0.1 and we cannot uniquely determine h[n]

H. C. So Page 60 Semester B 2024-2025

Find the difference equation of a LTI system whose transfer function is given by

$$H(z) = \frac{\left(1 + z^{-1}\right)\left(1 - 2z^{-1}\right)}{\left(1 - 0.5z^{-1}\right)\left(1 + 2z^{-1}\right)}$$

Let H(z) = Y(z)/X(z). Performing cross-multiplication and inverse z transform, we obtain:

$$(1 - 0.5z^{-1}) (1 + 2z^{-1}) Y(z) = (1 + z^{-1}) (1 - 2z^{-1}) X(z)$$

$$\Rightarrow (1 + 1.5z^{-1} - z^{-2}) Y(z) = (1 - z^{-1} - 2z^{-2}) X(z)$$

$$\Rightarrow y[n] + 1.5y[n - 1] - y[n - 2] = x[n] - x[n - 1] - 2x[n - 2]$$

Examples 5.20 and 5.21 imply the equivalence between the difference equation and transfer function

H. C. So Page 61 Semester B 2024-2025

Compute the impulse response h[n] for a LTI system which is characterized by the following difference equation:

$$y[n] = x[n] - x[n-1]$$

Applying z transform on the difference equation with the use of the linearity and time shifting properties, H(z) is:

$$Y(z) = X(z) (1 - z^{-1}) \Rightarrow H(z) = \frac{Y(z)}{X(z)} = 1 - z^{-1}$$

There is only one ROC possibility, namely, |z| > 0. Taking the inverse z transform on H(z), we get:

$$h[n] = \delta[n] - \delta[n-1]$$

which agrees with Example 3.12

Determine the output y[n] if the input is x[n] = u[n] and the LTI system impulse response is  $h[n] = \delta[n] + 0.5\delta[n-1]$ 

The z transforms for x[n] and h[n] are

$$X(z) = \frac{1}{1 - z^{-1}}, \quad |z| > 1 \quad \text{ and } \quad H(z) = 1 + 0.5z^{-1} \quad |z| > 0$$

As a result, we have:

$$Y(z) = X(z)H(z) = \frac{1}{1 - z^{-1}} + 0.5 \frac{z^{-1}}{1 - z^{-1}}, \quad |z| > 1$$

Taking the inverse z transform of Y(z) with the use of the time shifting property yields:

$$y[n] = u[n] + 0.5u[n-1]$$

which agrees with Example 3.8
